FREE REVIT PLUGIN

REVIT DETAILING: 1 FULL DAY → MINUTES.

One click numbers every cabinet and tags every elevation and section. Plus the AI prompts we used to build it.

280+ CABINETS

80+ DRAWINGS

1,000+ TAGS

THE PLUGIN

WHAT IT DOES

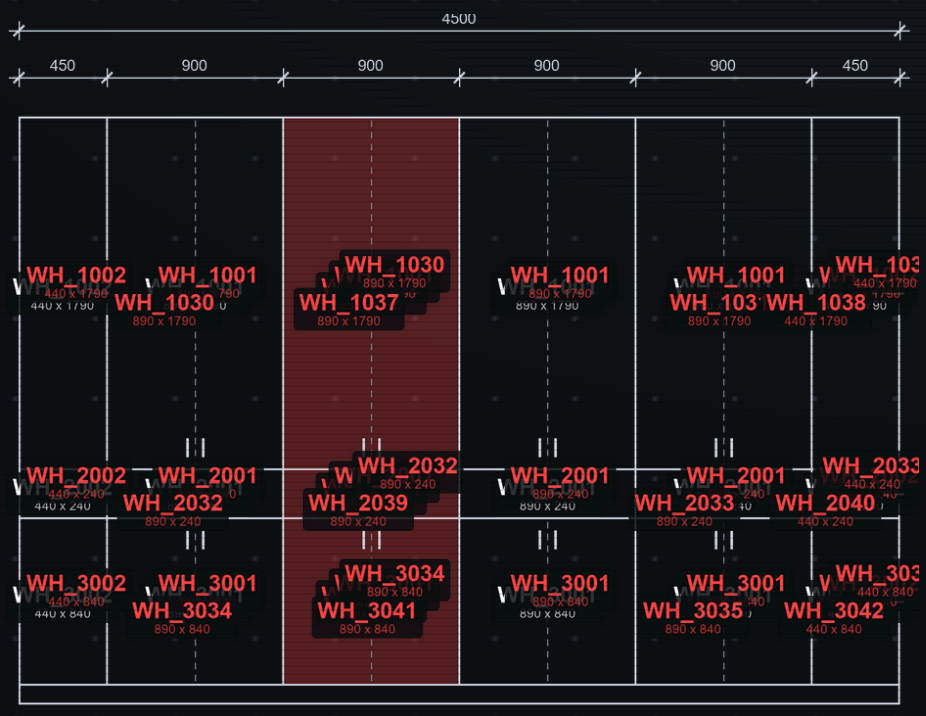

Numbers every cabinet
Pos_Nr by series: upper 1001+, middle 2001+, lower 3001+.

Same size + colour = same number
Sizes compared to the nearest mm. Identical cabinets never get two numbers.

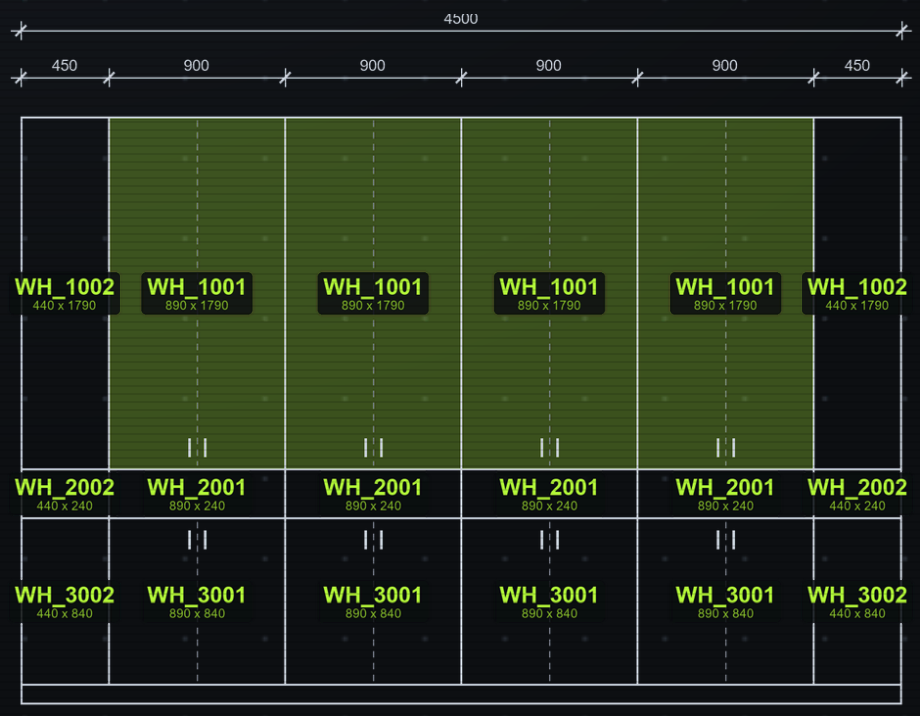

Tags every elevation and section
One run, all views. Only cabinets you can actually see, so tags never pile up.

Safe to run again
A second run adds 0 tags. No duplicates, ever.

BEFORE: BY HAND

AFTER: 1 CLICK

STEP 1 · DOWNLOAD

GET IT FROM GITHUB

`github.com/kayyox18/revit-casework-autotag`

1 **Open the link**
On your PC (not your phone), open the GitHub link above.

2 **Download the ZIP**
Scroll to **Download** and click `Revit-Casework-AutoTag-v1.0.6.zip`. It downloads straight away.

3 **Unzip it**
Right-click the ZIP → **Extract All** → Extract. You get 4 files.

INSIDE THE ZIP

`RevitCaseworkAutoTag.dll` · the add-in
`RevitCaseworkAutoTag.addin` · tells Revit where it is
`Install.cmd` · 1-click installer
`READ ME FIRST.txt` · these steps, offline

Works with
Revit 2022 · 2023 · 2024

Not yet
Revit 2025 and newer

STEP 2 · INSTALL

ADD IT TO REVIT

1 Close Revit
The installer can't update a file Revit is using.

2 Double-click Install.cmd
Windows may warn you: click **Run**, or **More info** → **Run anyway**. It installs for every Revit 2022–2024 on your PC.

3 Open Revit → Always Load
Revit asks about **Revit Casework AutoTag** once. Click **Always Load**.

4 Find it
Add-Ins tab → **External Tools**: *Pos_Nr by series* and *Tag all casework in elevations/sections*.

"Could not load… network location"?
Windows blocked the downloaded DLL. Right-click the `.dll` → Properties → tick **Unblock** → OK. (Install.cmd does this for you.)

Installer blocked? Do it by hand
Copy `RevitCaseworkAutoTag.addin` to `%APPDATA%\Autodesk\Revit\Addins\4\` and the `.dll` into a folder `RevitCaseworkAutoTag` next to it (use your Revit year). To uninstall, delete both.

ONE-TIME SETUP

SET UP YOUR FAMILIES

The plugin reads these. Set them once in your family library and every project works.

Category
Your cabinets are **Casework** families.

Series
The type's `Description` contains **Above**, **Middle** or **Lower**. That picks the 1000 / 2000 / 3000 series.

Number goes here
An instance parameter `Pos_Nr` (text or integer). Colours starting `M_SS_` / `M_GI_` / `M_GL_` get a short prefix, e.g. `SS_1001`.

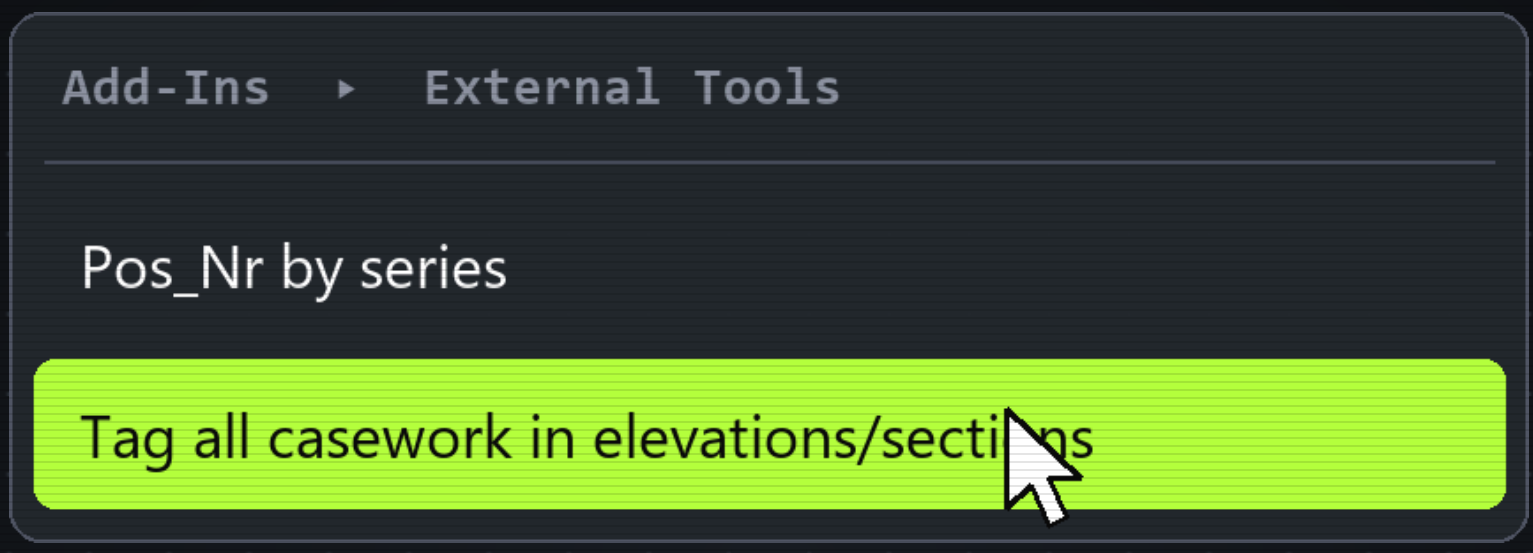

Colour
A colour/material text parameter `Farbe` (German for colour). Without it, cabinets match on size only.

Size
`Width` / `Height` on the instance or type (also `Breite` / `Höhe`), or Revit's built-in family width/height.

Tag
A **Casework Tag** family loaded in the project that shows `Pos_Nr`.

IN REVIT

USE IT: 2 CLICKS

1 **Add-Ins → External Tools → Pos_Nr by series**
Every cabinet gets its number. A pop-up shows how many were updated (283 in our project, in about 2 seconds).

2 **Tag all casework in elevations/sections**
Every visible cabinet in every elevation and section gets a tag (1,065 tags across 80 views for us).

! Good to know
Already have old tags? Delete them first: select one tag → right-click → Select All Instances → In Entire Project → Delete. On big projects Revit shows "Not Responding" for a few minutes. Just wait.

THE BUG WE HAD TO BEAT

WHY 1190 ≠ 1190

Two identical 1190 mm cabinets kept getting different numbers. Revit stores lengths in feet, with tiny floating-point noise:

1190 mm is stored as

3.90419947**6**065**5143** ft

3.90419947**5**065**6386** ft

compared to 17 decimals → "different" → new number

Fix: round to the nearest mm before comparing

Same size + same colour now always means the same number.

Also fixed: duplicate tags

A Revit 2023+ API change made every run stack a second set of tags (430 → 860). Now a second run adds 0.

Also fixed: 2,122 overlapping tags → 0

Only cabinets that face the view and aren't hidden behind something get tagged.

COPY-PASTE PROMPTS

4 PROMPTS WE ACTUALLY USED

1 · RUN REVIT YOURSELF

> “You can run Revit yourself. Write a small test add-in that waits until the model is open, runs my command, writes the results to a log file and closes Revit. Start Revit from the command line with a **copy** of my model. Never touch my own file.”

2 · FIND THE REAL CAUSE

> “This add-in gives identical cabinets different numbers. Run it on the test model, group cabinets by size and material, and print the raw values it compares. Find the real cause before you change any code.”

3 · FIX IT + PROVE IT

> “Fix it, rebuild the DLL and run it on every elevation and section. Give me a before/after table: duplicate numbers, overlapping tags, untagged cabinets. Export the worst view before and after as PNG.”

4 · SHIP IT

> “Make a one-click installer for Revit 2022–2024 that copies the DLL and .addin to the right folder and unblocks the DLL. Show a clear message if Revit is still open.”

Tip: run the AI agent (we use Claude Code) on the same PC as Revit, so it can build the DLL, launch Revit and read the results itself.

SAVE YOURSELF HOURS

6 LESSONS WE LEARNED

1. Never compare Revit lengths directly. Round them to the mm first.
2. Revit's API changes between versions. Test in the exact version your team uses.
3. Tag only what the view really shows: facing the view, not hidden behind a wall.
4. Make every command safe to run twice.
5. Windows blocks downloaded DLLs. Ship an installer that unblocks them.
6. Test on a copy of the model, never the live project.

YOUR TASK NEXT?

GOT A REVIT TASK YOUR TEAM DOES BY HAND EVERY WEEK?

Reply to this message with:

- What the task is (numbering, tagging, sheets, schedules, exports…)
- A screenshot or a small sample file (a copy, never your live project)
- Your Revit version

We'll tell you if it can be automated, and how fast.
